### **EXECUTIVE SUMMARY**

### Introduction

Impact Fees are a mechanism for funding the public infrastructure necessitated by new development. Across the country, they are used to fund police and fire facilities, parks, schools, roads and utilities. In Texas, the legislature has allowed their use for water, wastewater, roadway and drainage facilities. Since 2003, they have been used to fund public water and wastewater improvements in the City of Georgetown. For the purposes of this study, the term "Transportation Impact Fee" is meant to construe applicable requirements for "roadway impact fees" in state law.

In the most basic terms, impact fees are meant to recover the incremental cost of the impact of each new unit of development creating new infrastructure needs. In the case of Transportation Impact Fees, the infrastructure need is the increased capacity on arterial and collector roadways that serve the overall transportation system. The purpose of the 2020 Transportation Impact Fee Study is to identify the fee per unit of new development necessary to fund these improvements in accordance with the enabling legislation, Chapter 395 of the Texas Local Government Code.

Impact Fees are a mathematical calculation that determines a maximum impact fee that would be equivalent for growth paying for growth. The Maximum Transportation Impact Fee per Service Unit for Roadway Facilities is considered an appropriate measure of the impacts generated by a new unit of development on the City's Roadway System. An impact fee program is anticipated to be designed so that it is predictable for both the development community and City. An impact fee program is equitable since similar developments pay a similar fee regardless if they are the first or last to develop. An impact fee program is transparent. This report describes in detail how the fee is calculated and how a Capital Improvement Advisory Committee, referred to as an Impact Fee program. An impact fee program is flexible in that funds can be used on priority projects and not just on projects adjacent to a specific development. An impact fee program is consistent with other City goals and objectives for growth. For example, the actual collection rate set by Council may be determined to be less than the Maximum Transportation Impact Fee to achieve and be in alignment with other City goals and objectives for growth.

#### Impact Fee Basics

Transportation Impact Fees are determined by several key variables, each described below in greater detail.

### Impact Fee Study

The 2020 Transportation Impact Fee Study is to determine the maximum impact fee per unit of new development chargeable as allowed by the state law. This determination is not a recommendation; the actual fee amount ultimately assessed is at the discretion of the Georgetown City Council, so long as it does not exceed the maximum assessable fee allowed by law. The study looks at a period of 10 years to project new growth and corresponding capacity needs, as required by state law. The study and corresponding maximum fees must be restudied at least every five years. However, the study can be updated at any time to accommodate significant changes in any of the key variables of the impact fee equation.

### Service Areas

A Service Area is a geographic area within which a unique maximum impact fee is determined. All fees collected within the Service Area must be spent on eligible improvements within the same Service Area. For Transportation Impact Fees, the Service Area may not exceed 6 miles. In Georgetown, this restriction necessitated the creation of 9 separate Service Areas. A map of the Service Areas can be found on Page 14.

In defining the Service Area boundaries, the project team considered the corporate boundary, required size limit, adjacent land uses, highway facilities, and topography. Since each Service Area has a unique maximum impact fee, the per-unit maximum fee for an identical land use will vary from one Service Area to the next. For this reason, the project team avoided drawing a Service Area boundary through uniform land uses where possible.

#### Land Use Assumptions

The Impact Fee determination is required to be based on the projected growth and corresponding capacity needs in a 10-year window. This study considers the years 2020-2030. Acknowledging that the parameters of the study (the corporate boundaries, Overall Transportation Plan,

Comprehensive Plan, zoning maps, platting history, etc.) are changing constantly, this study is based on conditions as they were on July 31, 2019.

One of the key elements in the determination of the impact fee is the amount of new development anticipated over 10 years. The residential and non-residential growth projections were performed using the City of Georgetown's Comprehensive Plan growth projections and compared with the historical building permit data and development pipeline anticipated projects.

### Transportation Impact Fee Capital Improvements Plan

The Transportation Impact Fee Capital Improvements Plan (TIF CIP) is distinct and separate from the City's traditional Capital Improvements Plan (CIP). The TIF CIP is a list of projects eligible for funding through impact fees. The City's Overall Transportation Plan (OTP) is the plan for the infrastructure that is estimated to be necessary to accommodate the expected growth. Only those capacity improvements included in the City's OTP are included in the TIF CIP. Capacity improvements may include the addition of lanes, intersection improvements, or the extension of a new road. Resurfacing or other maintenance activities do not qualify as capacity improvements under impact fee law in Texas and cannot be funded with Transportation Impact Fees.

The cost of the TIF CIP is one of the fundamental factors in the calculation of the per-unit maximum impact fee. The TIF CIP's cost was calculated through systematic evaluation of each eligible project. The project team visited each project site to determine the project scope, the presence of any special conditions (such as the need for significant drainage improvements or railroad crossings) and whether various additional construction costs were applicable (such as costing for significant grades). In determining project limits, the team identified roadway segments with uniform need. For example, DB Wood Rd was previously constructed from Williams Drive to the Public Safety Operations and Training Center as a 4-lane divided roadway using previous transportation bond dollars, while a portion of the roadway is a 4-lane undivided roadway with a center turn lane recommended for access management, and the remainder of DB Wood Dr to W University Avenue is shown as a widening to a 4-lane divided roadway from the existing 2-lane undivided section (a portion of which is funded by the 2015 Road Bond, but for which debt has not been issued nor constructed). These were split as three separate projects based on uniform need. Developing unit costs from recently bid

City projects and TxDOT moving average bid prices, uniform costs were determined for the major items of work, additional construction items, and project delivery costs. Section III provides a listing of the 10-Year TIF CIP by service area in Tables 3.A – 3.SC and maps of the TIF CIP by service area in Exhibits 4.A – 4.SC. Note, the Downtown and Lake Georgetown Service Areas do not have a 10-year TIF CIP because these areas of the City were determined to not have an Impact Fee administered due to the lack of TIF eligible CIP projects. Finally, detailed cost projections by project can be found in Appendix A. It should be noted that these cost projections are based on conceptual level planning and are subject to refinement upon final design.

Only those projects listed in the TIF CIP are eligible to utilize impact fee funds. In order to optimize future flexibility, all capacity improvements included in the Overall Transportation Plan are included in the TIF CIP and will be eligible to utilize impact fee funds, unless the capacity improvement was determined to be completed "by others" as shown in the TIF CIP. In some cases, an interim project designation was used due to the ultimate build out not being needed in the 10-year window. An example of this is Westinghouse Rd east of FM 1460, which is shown as a 4-lane divided road widening in the TIF CIP, but ultimately will be built out to a 6-lane divided road based on the Overall Transportation Plan.

Only the costs associated with providing the additional capacity necessitated by 10 years of growth can be used to calculate the maximum impact fee. To calculate the maximum impact fee, the total cost of the TIF CIP at build-out was reduced to account for (1) the portion of new capacity that will address existing needs, including existing deficiencies, (2) the portion of new capacity that will not be necessitated until beyond the 10-year growth window, and (3) contributions already made by current developments. A ratio that compares 10 years' demand for capacity to the net supply of capacity (total new capacity in the TIF CIP minus existing needs) can be calculated. That ratio, which may not exceed 100%, is then applied to the cost of the net capacity supplied. The result is a determination of the costs attributable to the next 10 years' growth, which is then used to calculate the maximum impact fee in accordance with state law. The result is defined as the recoverable cost of the TIF CIP.

#### Service Unit

The "service unit" is a measure of consumption or use of the capital facilities by new development. In other words, it is the unit of measure used in the 2020 Transportation Impact Fee Study to quantify the supply and demand for roads in the City. For transportation purposes, the service unit is defined as a vehicle-mile. The definition for vehicle-mile is as follows: a vehicle-mile is the capacity consumed in a single lane in the PM peak hour by a vehicle making a trip one mile in length. The PM Peak is used as the basis for transportation planning and the estimation of trips caused by new development.

#### Impact Fee Calculation

In simplest terms, the maximum impact fee allowable by law is calculated by dividing the recoverable cost of the TIF CIP by the number of new service units of development. In accordance with state law, both the cost of the TIF CIP and the number of new service units of development used in the equation are based on the growth and corresponding capacity needs projected to occur within a 10-year window. This calculation is performed for each service area individually; each service area has a stand-alone TIF CIP and 10-year growth projection.

In practice, there are many factors that complicate this calculation. The maximum impact fee allowable by law for each service area is calculated in Table 8. A detailed discussion of the calculation precedes Table 8, beginning on Page 58.

### Collection and Use of Transportation Impact Fees

Transportation Impact fees are assessed when a final plat is recorded. The assessment defines the impact of each unit at the time of platting, according to land use, and may not exceed the maximum impact fee allowed by law. An existing plat would be assessed at the adoption of the ordinance and would be exempt from impact fees for one year. Transportation Impact Fees are collected when a building permit is issued. Therefore, funds are not collected until development-impacts are introduced to the transportation system. Funds collected within a service area can be used only within the same service area. Finally, fees must be utilized within 10 years of collection in the designated service area or must be refunded with interest. Fees should be utilized in a first in, first out basis.

### Adoption Process

Chapter 395 of the Texas Local Government Code stipulates a specific process for the adoption of Transportation Impact Fees. A Capital Improvements Advisory Committee, called an "Impact Fee Advisory Committee" (IFAC) for this report, is required to review the Land Use Assumptions and TIF CIP used in calculating the maximum fee, and to provide the Committee's findings for consideration by the City Council. The IFAC also reviews the Transportation Impact Fee ordinance and provides its findings to the City Council. The composition of the IFAC is required to adequately represent the building and development communities. The City Council then conducts a public hearing on the Land Use Assumptions, TIF CIP and Impact Fee Ordinance. Two public hearings are required for the 2020 Transportation Impact Fee study, one for Land Use Assumptions and TIF CIP, and another for the Impact Fee Calculation and Ordinance.

Following policy adoption, the IFAC is tasked with advising the City Council of the need to update the Land Use Assumptions or the TIF CIP at any time within five years of adoption. Finally, the IFAC oversees the proper administration of the Impact Fee, once in place, and advises the Council as necessary.

### 2020 Transportation Impact Fee Study Results

Below is the listing of the 2020 Maximum Assessable Impact Fee Per Service Unit (Vehicle-Mile):

Service Area	Maximum Fee Per Service Unit (per Vehicle-Mile)
A	\$1,699
В	\$2,152
С	\$3,315
D	\$1,405
E	\$3,101
F	\$4,577
Sun City	\$1,247
Lake Georgetown	\$0
Downtown	\$0

### I. INTRODUCTION

Chapter 395 of the Texas Local Government Code describes the procedure political subdivisions must follow to create and implement impact fees. Chapter 395 defines an Impact Fee as "a charge or assessment imposed by a political subdivision against new development to generate revenue for funding or recouping the costs of capital improvements or facility expansions necessitated by and attributable to the new development."

The City has retained Kimley-Horn and Associates, Inc. to provide professional transportation engineering services for the 2020 Transportation Impact Fee Study. This report includes details of the Transportation Impact Fee calculation methodology in accordance with Chapter 395, the applicable Land Use Assumptions, development of the Transportation Impact Fee Capital Improvements Plan (TIF CIP), and the Land Use Vehicle-Mile Equivalency Table.

This report references two of the basic inputs to the Roadway Impact Fee:

- 1) Land Use Assumptions (Pg. 9)
- 2) Roadway Impact Fee Capital Improvements Plan (TIF CIP) (Pg. 16)

Information from these Land Use Assumptions and TIF CIP is used extensively throughout the remainder of the report.

There is a detailed discussion of the methodology for the computation of impact fees. This discussion is broken into three components:

- 1) Methodology for Transportation Impact Fees (Pg. 34)
- 2) Transportation Impact Fee Calculation (Pg. 54)
- 3) Plan for Financing and the Ad Valorem Tax Credit (Pg. 57)

The components of the Computation Method for Roadway Impact Fee include development of:

- Service Areas (Pg. 34)
- Service Units (Pg. 34)
- Cost Per Service Unit (Pg. 36)
- TIF CIP Costing Methodology (Pg. 36)
- Summary of TIF CIP Costs (Pg. 40)
- Service Unit Calculation (Pg. 48)

The Transportation Impact Fee is then calculated as:

- Maximum Assessable Impact Fee Per Service Unit (Pg. 54)
- Service Unit Demand Per Unit of Development (Pg. 62)

The report also includes a section concerning the Plan for Financing and the Ad Valorem Tax Credit. This involves the calculation of the applicable credit required by law to offset the City's use of ad valorem taxes to help fund the TIF CIP. This plan, prepared by NewGen Strategies, and upon which we relied, details the maximum assessable impact fee per service unit the City of Georgetown may apply under Chapter 395 of the Texas Local Government Code.

### II. LAND USE ASSUMPTIONS

### A. Purpose and Overview

In order to assess an impact fee, Land Use Assumptions must be developed to provide the basis for residential and employment growth projections within a municipality. As defined by Chapter 395 of the Texas Local Government Code, these assumptions include a description of changes in land uses, densities, and development in the service area. The land use assumptions are then used in determining the need and timing of transportation improvements to serve future development.

This report documents the process used to develop the Land Use Assumptions for the City of Georgetown's Transportation Impact Fee (TIF) study. In accordance with Chapter 395 of the Texas Local Government Code, roadway (transportation) impact fees must be calculated based on reasonable expectations of residential and employment growth within the next ten years (2020 – 2030).

Information from the following sources was compiled to complete the Land Use Assumptions:

- Overall Transportation Plan 2015
- Georgetown Comprehensive Plan Future Land Use Plan (March 2020)
- City of Georgetown Historical Building Permit Data 2012-2019
- Williamson Central Appraisal District (WCAD) Parcel Data (current as of January 2020)
- City of Georgetown staff
- City of Georgetown Development Pipeline (9/30/2019 version)

This Land Use Assumptions Summary includes the following components:

- Land Use Assumptions Methodology An overview of the general methodology used to generate the land use assumptions.
- Transportation Impact Fee Service Areas Explanation of the division of Georgetown into service areas for roadway and infrastructure facilities.
- Residential and Employment Growth Data on residential and employment growth within each service area over the next ten years (2020 2030).
- Land Use Assumptions Summary Table A synopsis of the Land Use Assumptions.

The residential and employment estimates and projections were compiled in accordance with the following categories:

*Units:* Number of dwelling units, both single and multi-family.

*Employment:* Square feet of building area based on three (3) different classifications. Each classification has unique trip making characteristics.

<u>Retail</u>: Land use activities which provide for the retail sale of goods which primarily serve households and whose location choice is oriented toward the household sector, such as grocery stores and restaurants.

<u>Service</u>: Land use activities which provide personal and professional services, such as government and other professional offices.

<u>Basic</u>: Land use activities that produce goods and services such as those which are exported outside of the local economy, such as manufacturing, construction, transportation, wholesale, trade, warehousing, and other industrial uses.

The above categories in the Land Use Assumptions match those used to develop the travel demand model for the City of Georgetown. These broader categories are used in the development of the assumptions for impact fees; however, expanded classifications used in the assessment of impact fees are found in the Land Use / Vehicle-Mile Equivalency Table (Pg. 64).

### B. Land Use Assumptions Methodology

The residential and non-residential growth projections formulated in this report were performed using reasonable and generally accepted planning principles. The following factors were considered in developing these projections:

- Character, type, density, and quantity of existing development;
- Emerging Projects;
- Historical growth trends

Determination of the ten-year growth within the Transportation Impact Fee study area was accomplished through two general steps:

- Step 1: Determine Base Year (2020)
- Step 2: Determine 10-Year Growth Projections (2020-2030)

### Step 1: Determine Base Year (2020)

Data was collected from WCAD in January 2020, which included parcel data in GIS format, as well as land information, improvement information, and other property data in tabular format. Information collected in tabular format was associated to parcels based on a common parcel identification number and used to determine if a property was vacant, building square footage for occupied parcels, and land use based on state code. State codes were used to determine whether a property was single family residential, multifamily residential, retail, service or basic non-residential land use, and geographically assign the base year land use assumptions for each service area. A conversion of square footage per unit was utilized to determine the number of units for multifamily land uses based on average multifamily unit sizes.

Step 2: Determine 10-Year Growth Projections (2020-2030)

The Future Land Use Plan in the 2020 Comprehensive Plan update was used to determine build-out conditions for the City of Georgetown. For the purposes of determining a 10-year window, it was assumed that 25% of the remaining growth to Build-Out in the City will occur in the next 10 years, with growth for 2020 to 2030 being determined by linear interpolation. Density of development used in the Comprehensive Plan and split of residential and non-residential land uses assumed for each Future Land Use were used to determine build out demographics. Build out residential units were broken out into a split of 20% multifamily units and 80% single family units based on historical data from 2000 to 2019 in the City of Georgetown.

The 2030 projections were compared to historical building permit data from 2000 to 2019 and emerging projects in the development pipeline tracked by the City to calibrate growth projections from the Comprehensive Plan and validate the 10-year growth assumptions.

From 2010 to 2019, 7,621 single family dwelling units were constructed and from 2010 to 2019, 3,550 multifamily units were constructed in the City of Georgetown. The average of the historical trends (assuming growth rate for historical years from 2010 to 2019 continues from 2020 to 2030), development pipeline projections and the Comprehensive Plan were used to determine growth projections. Finally, planned large non-residential projects were also added to the average of the Comprehensive Plan, development pipeline projections and historical trends to further calibrate the Land Use Assumptions shown in Table 1.

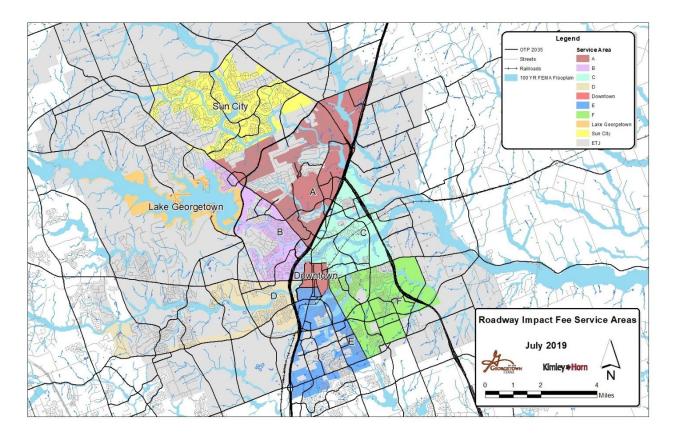

### C. Transportation Impact Fee Service Areas

The geographic boundary of the proposed impact fee service areas for transportation facilities is shown in Exhibit 1. The City of Georgetown is divided into nine (9) service areas, each based upon the six (6) mile limit, as required in Chapter 395. For transportation facilities, the service areas, as required by state law, are limited to areas within the current corporate City limits. In defining the Service Area boundaries, the project team considered the corporate boundary, required six (6) mile size limit, adjacent land uses, highways and topography. Since each Service Area will have a unique maximum impact fee, the per-unit maximum fee for an identical land use will vary from one Service Area to the next. For this reason, the areas of uniform land use were contained within the same Service Area where possible.

It should be noted that at locations where Service Area boundaries align with a City roadway, the proposed boundary is intended to follow the centerline of the roadway, unless otherwise noted. In cases where a Service Area boundary follows the City Limits, only those portions of the transportation facility within the City Limits are included in the Service Area. For example, if a Service Area Boundary follows the city limits, and one side of a transportation facility is in the City limits and the other is not, only 50% of the facility may be included in the TIF CIP. Another example is where the Service Area boundary follows the edge of Right-of-Way for a transportation facility, but the Right-of-Way and other side of the transportation facility is out of the City Limits. In this case, 50% of the transportation facility is included in the TIF CIP. For intersection projects along a Service Area boundary, only the corners of the intersection that fall within a Service Area boundary are considered for inclusion in the respective Service Area. For example, if one corner of an intersection is outside of the City Limits, one corner is in one service area, and the remaining two corners are in another service area, the first service area would include 25% of the intersection project, and the second would include 50% of the intersection project.

### Exhibit 1 – Proposed Service Areas

### D. Land Use Assumptions Summary

Table 1 summarizes the residential and employment 10-year growth projections. Note that the Downtown and Lake Georgetown Service Areas are not included as it has been determined that these areas will have no transportation impact fee.

Service		Residential (Units)		Employment (Sq. Ft.)			
Area	Year	Single Family	Multi- Family	Basic	Service	Retail	Total
А		2,720	680	180,000	800,000	710,000	1,690,000
В		838	209	64,800	510,000	510,000	1,084,800
С		1,080	270	108,000	648,000	396,000	1,152,000
D	2020-	1,502	376	21,600	310,000	350,000	681,600
E	2030	1,090	273	-	430,000	430,000	860,000
F		2,094	524	25,200	576,000	360,000	961,200
Sun City		3,880	970	-	324,000	360,000	684,000
Total		13,205	3,301	400,000	3,600,000	3,120,000	7,113,600

Table 1. Residential and Employment 10-Year Projections

### III. TRANSPORTATION IMPACT FEE CAPITAL IMPROVEMENTS PLAN

The City has identified the transportation projects needed to accommodate the projected growth within the City. The City's Overall Transportation Plan (OTP) is the plan for the infrastructure that is estimated to be necessary to accommodate the expected growth. The Transportation Impact Fee Capital Improvements Plan (TIF CIP) consists of 4 categories of projects for roadway facilities as well as intersection projects described on Pg. 17 of this report. They are as follows:

- Previously Constructed Identified corridors that were previously constructed and have excess capacity for future development yet to be utilized.
- Widening Existing roadways not currently built to the ultimate class in the Overall Transportation Plan and must be completely reconstructed
- Access Management Existing 5 Iane undivided roadways identified for median construction in the existing center turn lane for access management purposes.
- New All future roadways needed to complete the Overall Transportation Plan

The TIF CIP includes arterial class roadway facilities, collector facilities as well as major intersection improvements. Roadway facilities identified are included in the Overall Transportation Plan except for some roadway alignment modifications due to city direction and some collector widenings identified through discussion with City Staff. Some collector facilities were identified as being built by others through development agreements or other agencies such as Williamson County or TxDOT or being funded through other measures that would preclude inclusion in the TIF CIP and are shown as "By Others" in Exhibit 2.A – 2.SC. Through evaluation of the Overall Transportation Plan with City staff, some facilities were identified that were downgraded from their functional classification ultimate number of lanes to reflect capacity lane needs in a 10-year window.

In addition to roadway facilities, major intersection improvements were identified by determining capacity needs through either turn lanes or improved traffic control measures based on Overall Transportation Plan functional classifications of intersecting roadways. Intersection Improvements were categorized as follows:

- Signal either a new signal or modification to an existing signal due to construction of a new roadway approach to an existing signalized intersection
- Roundabout a new roundabout intersection
- Turn Lane addition or extension of a turn lane consistent with TxDOT lane length recommendations based on roadway classification
- Overpass identified new grade separated crossings in OTP
- Innovative construction of an intersection improvement to be determined after complete analysis. This includes improvements such as special intersections (Continuous Flow Intersections (CFI), Diverging Diamond Intersections (DDI), or grade separation improvements)
- Other (ITS System Upgrades) This item was identified by City staff and was split evenly between the nine (9) service areas for developing the roadway impact fee.

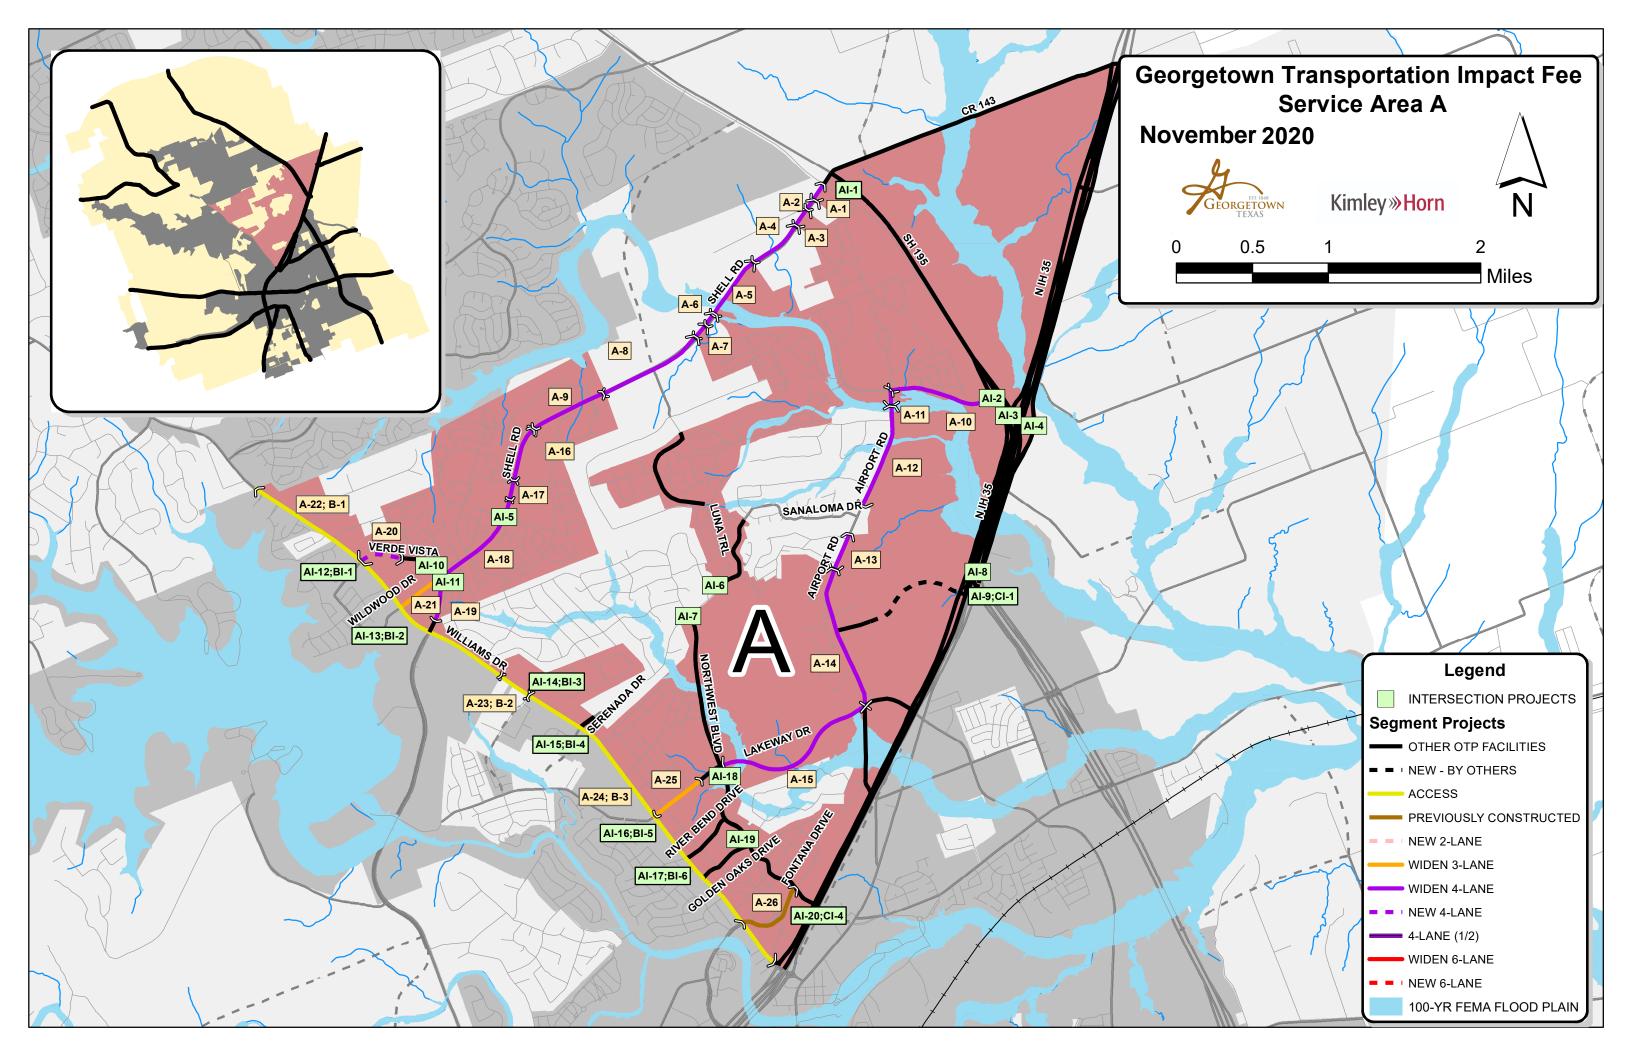

All intersection improvement recommendations are recommended to undergo a design level evaluation before implementation to ensure the most appropriate improvements are made. In the case where a design level evaluation determines improvements contrary to the TIF CIP, such as turn lane improvements in place of a signal, the TIF CIP cost allocated to the intersection may still be applied to the alternate improvements.

The proposed TIF CIP is listed in Tables 2.A – 2.SC and mapped in Exhibits 2.A – 2.SC. The tables show the length of each project as well as the facility's typology. The TIF CIP was developed in conjunction with input from City of Georgetown staff and represents projects that will be needed to accommodate the growth projected in the Land Use Assumptions section of this report.

### Table 2.A. 10-Year Transportation Impact Fee Capital Improvements Plan – Service Area A

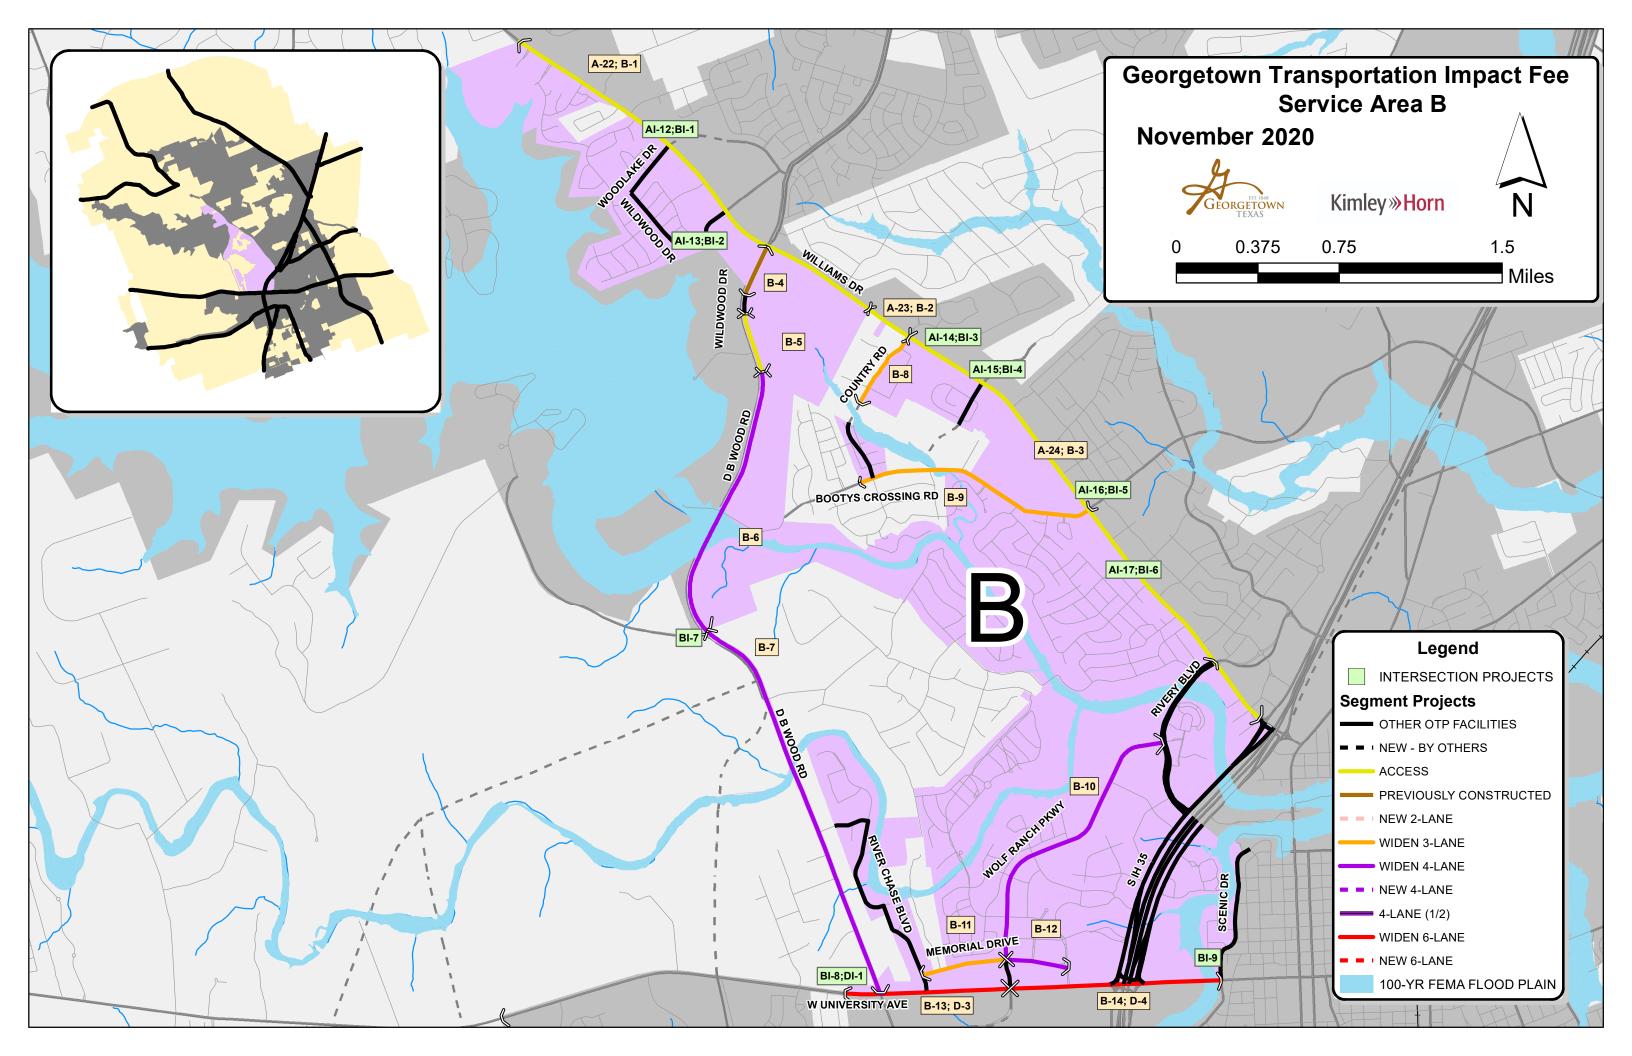

Service Area	Proj. #	IF Class	Roadway	Limits	Length (mi)	% In Service Area
	A-1	4 Lane Major Arterial	Shell Rd (1)	Sh 195 Wb To 1200' S Of Sh 195	0.11	50%
	A-2	4 Lane Major Arterial	Shell Rd (2)	1200' S Of Sh 195 To 200' S Of Shell Stone Trl	0.09	100%
	A-3	4 Lane Major Arterial	Shell Rd (3)	200' S Of Shell Stone Trl To Scenic Oaks Dr	0.11	50%
	A-4	4 Lane Major Arterial	Shell Rd (4)	Scenic Oaks Dr To 2015' S Of Scenic Oaks Dr	0.38	100%
	A-5	4 Lane Major Arterial	Shell Rd (5)	2015' S Of Scenic Oaks Dr To 4315' S Of Scenic Oaks Dr	0.44	50%
	A-6	4 Lane Major Arterial	Shell Rd (6)	4315' S Of Scenic Oaks Dr To 4790' S Of Scenic Oaks Dr	0.09	100%
	A-7	4 Lane Major Arterial	Shell Rd (7)	4790' S Of Scenic Oaks Dr To 5170' S Of Scenic Oaks Dr	0.09	50%
	A-8	4 Lane Major Arterial	Shell Rd (8)	1870' S Of Shell Spur To 5170' S Of Scenic Oaks Dr	0.71	100%
	A-9	4 Lane Major Arterial	Shell Rd (9)	900' S Of Bowline Dr To 300' N Of Sycamore St	0.53	50%
	A-10	4 Lane Minor Arterial	Berry Creek Dr	Airport Rd To Sh 195	0.70	100%

# IV. METHODOLOGY FOR TRANSPORTATION IMPACT FEES

## A. Service Areas

The nine (9) service areas used in the 2020 Transportation Impact Fee Study are shown in the previously referenced Exhibit 1. These service areas cover the entire corporate area of the City of Georgetown. Chapter 395 of the Texas Local Government Code specifies that "the service area is limited to an area within the corporate boundaries of the political subdivision and shall not exceed six (6) miles." The service areas in the 2020 Transportation Impact Fee Study are consistent with the specification of Chapter 395 of the Texas Local Government Code.

## B. Service Units

The "service unit" is a measure of consumption or use of the capital facilities by new development. In other words, it is the unit of measure used in the 2020 Transportation Impact Fee Study to quantify the supply and demand for roads in the City. For transportation purposes, the service unit is defined as a vehicle-mile. Below is the definition for vehicle-mile.

<u>Vehicle-Mile</u>: The capacity consumed in a single lane in the PM peak hour by a vehicle making a trip one mile in length. The PM Peak is used as the basis for transportation planning and the estimation of trips caused by new development.

<u>Total Vehicle-Miles of Supply</u>: Based on the total length (miles), number of lanes, and capacity (vehicles per hour) provided by the Overall Transportation Plan projects listed in the CIP (see Appendix B).

<u>Total Vehicle-Miles of Demand</u>: Based on the 10-year growth projections (Pg. 52). The demand is equal to PM Trip Rate (trips) \* Trip Length (miles).

The capacity values used in the 2020 Transportation Impact Fee Study are based upon Capacity Criteria published by the Capital Area Metropolitan Planning Organization (CAMPO) and modified to reflect local context within the City of Georgetown corporate limits. Tables 3A and 3B show the service volumes as a function of the facility classification and type for existing and proposed facilities.

Table 3A. Service Volumes for Proposed Facilities (used in Appendix B – Transportation Impact Fee CIP Service Units of Supply)

Facility Classification	Lanes	Median Configuration	Hourly Vehicle-Mile Capacity per Lane-Mile of Roadway Facility
New/Widen 6 Lane	6	Divided	900
New/Widen 4 Lane	4	Divided	810
Widen 3 Lane	3	Undivided	510
New 2 Lane	2	Undivided	410

 Table 3B. Service Volumes for Existing Facilities

Roadway Type	Description	Hourly Vehicle-Mile Capacity per Lane-Mile of Roadway Facility
2U-G	Rural Cross-Section (i.e., gravel, dirt, etc.)	100
2U	Two lane undivided – built-out	410
2U-OP	Two lane undivided with on-street parking	330
2D	Two lane divided	550
3U	Three lane undivided (two-way, left-turn lane)	510
4U	Four lane undivided	680
4U-OP	Four lane undivided with on-street parking	580
4D	Four lane divided	810
5U	Five lane undivided	770
6D	Six lane divided	900

# C. Cost Per Service Unit

A fundamental step in the impact fee process is to establish the cost for each service unit. In the case of the Transportation Impact Fee, this is the cost for each vehicle-mile of travel. Thus, it is the cost to construct a roadway (lane-mile) needed to accommodate a vehicle-mile of travel. The cost per service unit is calculated for each service area based on the roadway projects within that service area.

The second component of the cost per service unit is the determination of the number of service units in each service area. This number is the measure of the growth in transportation demand that is projected to occur in the ten-year period.

# D. Cost of the TIF CIP

All of the project costs for an arterial or collector facility which serves the overall transportation system are eligible to be included in the Transportation Impact Fee Capital Improvements Plan (TIF CIP). Chapter 395 of the Texas Local Government Code specifies that the allowable costs are "...including and limited to the:

- 1. Construction contract price;
- 2. Surveying and engineering fees;
- 3. Land acquisition costs, including land purchases, court awards and costs, attorney's fees, and expert witness fees; and
- 4. Fees actually paid or contracted to be paid to an independent qualified engineer or financial consultant preparing or updating the capital improvements plan who is not an employee of the political subdivision."

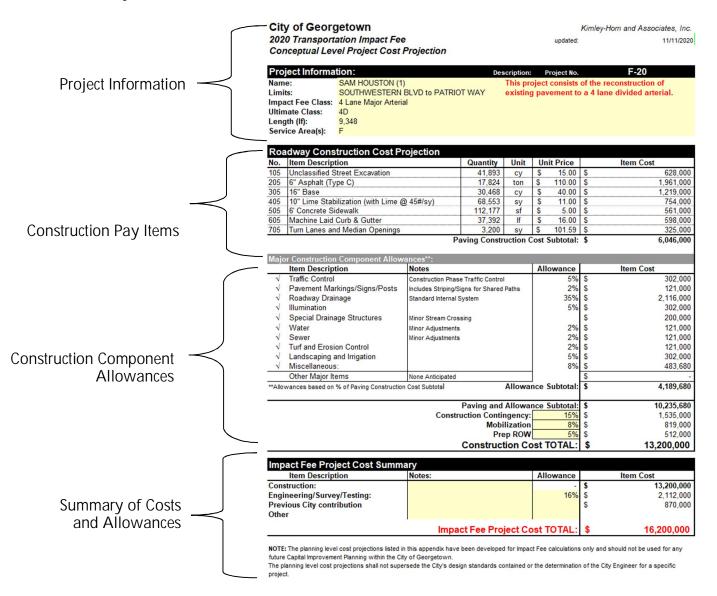

The engineer's opinion of the probable costs of the projects in the TIF CIP is based, in part, on the calculation of a unit cost of construction. This means that a cost per linear foot of roadway is calculated based on an average price for the various components of roadway construction. This allows the probable cost to be determined by the type of facility being constructed, the number of lanes, and the length of the project. The cost for location specific items such as bridges, highway ramps, drainage structures, and any other special components are added to each project, as appropriate. The following is a detailed description of the costing worksheet/methodology for the TIF CIP.

## 1. Overview of TIF CIP Costing Worksheets

For each project a specific costing worksheet was developed (see Appendix A). Each worksheet contained the following four (4) main components:

- Project Information,
- Construction Pay Items,
- Construction Component Allowances and
- Summary of Costs and Allowances

## 2. Project Information

In order to correctly estimate the cost of a roadway project, several attributes are first identified:

- <u>Project Number</u> Identifies which Service Area the project is in with a corresponding number. The corresponding number does not represent any prioritizations and is used only to identify projects. For example, Project F-20 is in Service Area F and is the 20<sup>th</sup> project on the list.
- <u>Name</u> A unique identifier for each project. In some cases, abbreviations are used for the project name.
- <u>Limits</u> Represents the beginning and ending location for each project.
- Impact Fee Class The costing class to be used in the analysis. The impact fee class provides the width for the various elements in the roadway. The construction costs are variable, based on the Overall Transportation Plan classification of the roadway. Modification to roadway element widths are utilized in cases where a portion of the facility currently exists and the road is only to be widened, or where the road is planned to be widened to an interim configuration. Examples of these are access management projects, which are designated in the summary sheets at the beginning of each service area's Conceptual Level Cost Projections in Appendix A. Other specialized cases are noted in the short description box located in this section, such as previously constructed projects with a known cost.
- <u>Ultimate Class</u> the ultimate classification of the roadway, if different from the Impact Fee Class based on determination of need in the 10-year window
- Length (ft) The distance measured in feet that is used to cost out the project.
- <u>Service Area(s)</u> Represents the service areas where the project is located. Multiple service areas will be listed if the project lies along a service area boundary, or if a different jurisdiction lies along the project, it will be noted.

## 3. Construction Pay Items

A typical roadway project consists of several costs, including the following: planning, survey, design engineering, permitting, right-of way acquisition, and construction and testing. While the construction cost component of a project may consist of approximately 100 various pay items, a simplified approach was used for developing the conceptual level project costs. The pay items used in the 2020 TIF CIP are as follows:

- Unclassified street excavation;
- HMAC Surface courses (asphalt, in depth);
- Flexible roadway base;
- Lime stabilized subgrade (only for service areas east of Interstate 35);
- Concrete sidewalks;
- Concrete curb and gutter; and
- Turn lanes and median openings.

## 4. Construction Component Allowances

A percentage of the paving construction cost is allotted for various major construction component allowances, as appropriate. These allowances include traffic control, pavement markings, signs and posts, roadway drainage, illumination, water and sewer adjustments, turf and erosion control, landscaping and irrigation, mobilization, and preparation of right-of-way. A miscellaneous allowance of 8% was allotted for water quality ponds. These allowance percentages are also based on historical data.

In addition, lump sum dollar allowances are provided for special drainage structures (bridges and culverts) and railroad crossings. The paving and allowance subtotal is given a fifteen percent (15%) construction contingency.

## 5. Summary of Cost and Allowances

To determine the total Impact Fee Project Cost, sixteen percent (16%) of the construction cost total is added for engineering, surveying, and testing. ROW/easement acquisition is not included in the project costs but is a recoverable cost per Chapter 395 of the Local Government Code.

The Impact Fee Project Cost Total is then the Construction Cost Total plus engineering, surveying, and testing; plus contingency, and minus roadway escrow agreements. In situations where other agencies have jurisdiction over roadways within the corporate limits, it was assumed the city contribution toward such projects would amount to 20% of the Impact Fee Project Cost Total, which aligns with historical contributions. Only the anticipated City contribution to roadway projects are recoverable per state law.

# E. Summary of Roadway Impact Fee CIP Costs

Tables 4.A – 4.SC are the 10-Year TIF CIP project lists for each service area with planning level project costs. Individual project cost worksheets can be seen in Appendix A, Conceptual Level Project Cost Projections. It should be noted that these tables reflect only conceptual-level opinions or assumptions regarding the portions of future project costs that are recoverable through impact fees. Actual project costs are likely to change with time and are dependent on market and economic conditions that cannot be predicted. The TIF CIP establishes the list of projects for which Impact Fees may be utilized. Projects not included in the TIF CIP are not eligible to receive impact fee funding. The cost projections utilized in this study should not be utilized for the City's construction CIP.

#### Table 4.A – 10-Year TIF CIP with Conceptual Level Cost Projections - Service Area A

Service Area	Proj. #	Class	Roadway	Limits	Length (mi)	% In Service Area	Total Project Cost	Cost in Service Area

## F. Service Unit Calculation

The basic service unit for the computation of Georgetown's Transportation Impact Fees is the vehicle-mile of travel during the afternoon peak-hour (as explained on Pg. 34). To determine the cost per service unit, it is necessary to project the growth in vehicle-miles of travel for the service area for the 10-year period.

The growth in vehicle-miles from 2020 to 2030 is based upon projected changes in residential units and employment for the period. To determine this growth, estimates of residential units, basic employment, service employment, and retail employment for 2020 were made, along with growth projections for each of these demographic statistics through 2030. The Land Use Assumptions section of this report details the growth estimates used for impact fee determination.

For the purposes of impact fees, all developed and developable land is categorized as either residential or non-residential. For residential land uses, the existing and projected number of dwelling units are estimated. The number of dwelling units in each service area is multiplied by a *transportation demand factor* (discussed in more detail below) to compute the vehicle-miles of travel that occur during the afternoon peak hour. This factor indicates the average amount of demand created by the residential land uses in the service area.

For non-residential land uses, the process is similar. The Land Use Assumptions section of this report provides existing and projected number of building square footages for three (3) categories of employment – basic, service, and retail. These categories correspond to an aggregation of other specific land use categories based on the North American Industrial Classification System (NAICS).

Building square footage is the most common independent variable for the estimation of non-residential trips in the *Institute of Transportation Engineers (ITE) Trip Generation Manual*, 10<sup>th</sup> Edition. This characteristic is more appropriate than the number of employees, because building square footage is tied more closely to trip generation and

is known at the time of application for any development that would require the assessment of an impact fee.

The existing and projected land use assumptions for the dwelling units and the square footage of basic, service, and retail land uses provide the basis for the projected increase in vehicle-miles of travel. As noted earlier, a *transportation demand factor* is applied to these values and then summed to calculate the total peak hour vehicle-miles of demand for each service area.

The transportation demand factors are aggregate rates derived from two sources – the ITE Trip Generation Manual, 10<sup>th</sup> Edition and the National Household Travel Survey performed by the Federal Highway Administration (FHWA). The ITE Trip Generation Manual, 10<sup>th</sup> Edition provides the number of trips that are produced or attracted to the land use for each dwelling unit, square foot of building, or other corresponding unit. For the retail category of land uses, the rate is adjusted to account for the fact that a percentage of retail trips are made by people who would otherwise be traveling past that particular establishment anyway, such as a trip between work and home. For example, a stop at a nearby supermarket on the way home from work does not create a new trip onto the roadway network. These trips are called pass-by trips, and since the travel demand is accounted for in the land use calculations relative to the primary trip, it is necessary to discount the retail trip generation rates to avoid double counting trips. The next component of the transportation demand factor accounts for the length of each trip. The average trip length for each category is based on the Capital Area Metropolitan Planning Organization (CAMPO) long-range transportation model and supplemented with the National Household Travel Survey conducted by the FHWA.

The computation of the transportation demand factor is based on the following equation:

Variables:

 $TDF = T * (1 - P_b) * L_{max}$ where...  $L_{max} = min(L * OD \text{ or } 6)$  TDF = Transportation Demand Factor, T = Trip Rate (peak hour trips / unit),  $P_b = Pass-By Discount (\% of trips),$   $L_{max} = Maximum Trip Length (miles),$  L = Average Trip Length (miles), and OD = Origin-Destination Reduction (50%)

The maximum trip length was limited to six (6) miles based on the maximum trip length within each service area. Chapter 395 of the Texas Local Government Code allows for a service area of six (6) miles, and the service areas within Georgetown are closely approximated with a six (6) mile distance.

The adjustment made to the average trip length statistic in the computation of the maximum trip length is the origin-destination reduction. This adjustment is made because the Transportation Impact Fee is charged to both the origin and destination end of the trip. For example, impact fee methodology will account for a trip from home to work within Georgetown to both residential and non-residential land uses. To avoid counting these trips twice as both residential and non-residential trips, a 50% origin-destination (OD) reduction factor is applied. Therefore, only half of the trip length is assessed to each land use, and the total trip is only counted once. This methodology is consistent with that used in the National Household Travel Survey. These lengths were developed based on the CAMPO long-range transportation model.

Table 5 shows the derivation of the *Transportation Demand Factor* for the residential land uses and the three (3) non-residential land use categories. The values utilized for all variables shown in the *transportation demand factor* equation are also shown in the table.

Variable	Residential, Single Family	Residential, Multifamily	Basic	Service	Retail
Т	0.99	0.56	0.63	1.15	3.81
Pb	0%	0%	0%	0%	34%

# V. TRANSPORTATION IMPACT FEE CALCULATION

# A. Maximum Assessable Impact Fee Per Service Unit

This section presents the maximum assessable impact fee rate calculated for each service area. The maximum assessable impact fee is the sum of the eligible TIF CIP costs for the service area divided by the growth in travel attributable to new development projected to occur within the 10-year period. A majority of the components of this calculation have been described and presented in previous sections of this report. The purpose of this section is to document the computation for each service area and to demonstrate that the guidelines provided by Chapter 395 of the Texas Local Government Code have been addressed. Table 7 illustrates the computation of the maximum assessable impact fee computed for each service area. Each row in the table is numbered to simplify explanation of the calculation. The calculation of the maximum assessable impact fee is shown in Table 8. The Transportation Impact Fee CIP consists of both roadway segment and intersection improvements. The roadway segment component is referred to as the "Roadway Impact Fee CIP," while the intersection component is referred to as the "Intersection Impact Fee CIP."

Table 7. Maximum Assessable Transportation Impact Fee Computation

Lin	е	Title	Description
1		Total Vehicle-Miles of Capacity Added by the Transportation Impact Fee CIP	The total number of vehicle-miles added to the service area based on the capacity, length, and number of lanes in each project (from Appendix B – Transportation Impact Fee CIP Units of Supply)

Each project identified in the TIF CIP will add a certain amount of capacity to the City's roadway network based on its length and classification. This line displays the total amount added within each service area.

2	Total Vehicle-Miles of Existing Demand	A measure of the amount of traffic currently using the roadway facilities upon which capacity is being added. (from Appendix B – Transportation Impact Fee CIP Units of Supply)
---	---	---

A number of facilities identified in the TIF CIP have traffic currently utilizing a portion of their existing capacity. This line displays the total amount of capacity along these facilities currently being used by existing traffic.

3	Total Vehicle-Miles of Existing Deficiencies	Number of vehicle-miles of travel that are not accommodated by the existing roadway system (from Appendix C – Existing Roadway Facilities Inventory)
---	---	--

In order to ensure that existing deficiencies on the City's roadway network are not recoverable through impact fees, this line is based on the entire roadway network within the service area. Any roadway within the service area that is deficient – even those not identified on the Transportation Impact Fee CIP – will have these additional trips removed from the calculation.

-			
	4	Net Amount of Vehicle-	A measurement of the amount of vehicle-miles added by the TIF CIP
	4	Miles of Capacity Added	that will not be utilized by existing demand (Line 1 – Line 2 – Line 3)

This calculation identifies the portion of the TIF CIP (in vehicle-miles) that may be recoverable through the collection of impact fees.

ſ		Total Cost of the	The total cost of the roadway (non-intersection) projects within each
	5	Roadway Impact Fee CIP	service area (from Table 4: 10-Year Transportation Impact Fee CIP
		within the Service Area	with Conceptual Level Cost Projections)

This line simply identifies the total cost of all the roadway projects identified in each service area.

6	Cost of Net Capacity Supplied	The total Roadway Impact Fee CIP cost (Line 5) prorated by the ratio of Net Capacity Added (Line 4) to Total Capacity Added (Line 1). [(Line 4 / Line 1) * (Line 5)]
---	----------------------------------	--

Using the ratio of vehicle-miles added by the Roadway Impact Fee CIP available to serve future growth to the total vehicle-miles added, the total cost of the TIF CIP is reduced to the amount available for future growth (i.e. excluding existing usage and deficiencies).

7	Cost to Meet Existing Needs and Usage	The difference between the Total Cost of the Roadway Impact Fee CIP (Line 5) and the Cost of the Net Capacity supplied (Line 6). (Line 5 – Line 6)
---	--	--

This line is provided for information purposes only – it is to present the portion of the total cost of the Roadway Impact Fee CIP that is required to meet existing demand.

8	Total Vehicle-Miles of New Demand over Ten	Based upon the growth projection provided in the Land Use Assumptions, an estimate of the number of new vehicle-miles within
	Years	the service area over the next ten years. (from Table 6)

This line presents the amount of growth (in vehicle-miles) projected to occur within each service area over the next ten years.

9	Percent of Capacity Added Attributable to New Growth	The result of dividing Total Vehicle-Miles of New Demand (Line 8) by the Net Amount of Capacity Added (Line 4), limited to 100% (Line 10). This calculation is required by Chapter 395 to ensure capacity
10	Chapter 395 Check	added is attributable to new growth.

In order to ensure that the vehicle-miles added by the Roadway Impact Fee CIP do not exceed the amount needed to accommodate growth beyond the ten-year window, a comparison of the two values is performed. If the amount of vehicle-miles added by the Roadway Impact Fee CIP exceeds the growth projected to occur in the next ten years, the Roadway Impact Fee CIP cost is reduced accordingly.

2020 Transportation Impact Fee Study City of Georgetown, Texas

11		The result of multiplying the Cost of Net Capacity Added (Line 6) by the Percent of Capacity Added Attributable to New Growth, limited to 100% (Line 10).
----	--	---

This value is the total Roadway Impact Fee CIP project costs (excluding financial costs) that may be recovered through impact fees. This line is determined considering the limitations to impact fees required by the Texas legislature.

I		Total Cost of the Intersection	The total cost of the intersection projects within each service area
	12	Impact Fee CIP within the Service	(from Table 4: 10-Year Transportation Impact Fee Capacity
		Area	Improvements Plan with Conceptual Level Cost Projections)

This line simply identifies the total cost of all the intersection projects identified in each service area.

ſ	13	Percent of Intersection Capacity Added Attributable to New	The result of dividing Total Vehicle-Miles of New Demand (Line 8) by the vehicle-mile carrying capacity in each service area
		Growth	(Table 6).

In order to ensure that the capacity added by the Intersection Impact Fee CIP does not exceed the amount needed to accommodate growth beyond the ten-year window, the anticipated vehicle mile growth in each service area is calculated as a percentage of the vehicle-mile carrying capacity.

14	Cost of Intersection Impact Fee CIP Attributable to New Growth	The result of multiplying the Cost of Net Capacity Added (Line 12) by the Percent of Capacity Added Attributable to New Growth (Line 13). (Line 12 * Line 13)
----	---	---

This value is the total Intersection Impact Fee CIP project cost (excluding financial costs) that may be recovered through impact fees. This line is determined considering the limitations to impact fees required by the Texas legislature.

15	Credit for Previous Contributions	The total contributions by development toward the building of improvements in the Transportation Impact Fee CIP.
----	-----------------------------------	--

This value is the total of all exactions upon development that resulted in a financial contribution towards future improvements in the Transportation Impact Fee CIP. This line is intended as a credit to development so as not to double charge for previous contributions for roadway capacity improvements.

16	Cost of Total Transportation Impact Fee CIP Attributable to New Growth	The result of adding the Cost of the Roadway Impact Fee CIP Attributable to new growth (Line 11) to the Cost of the Intersection Impact Fee CIP Attributable to new growth (Line 14) less credits for previous contributions (Line 11 + Line 14 – Line 15).
----	--	---

This value is the Total Transportation Impact Fee CIP project cost (excluding financial costs) that may be recovered through impact fees. This line is determined considering the limitations to impact fees required by the Texas legislature.

17	Pre-Finance, Pre-Credit Maximum Fee per Service Unit	Found by dividing the Cost of Total Transportation Impact Fee CIP Attributable to New Growth less Developer Contributions (Line 16) by the Total Vehicle-Miles of New Demand Over Ten years (Line 8). (Line 16 / Line 8).
----	---	--

This line represents the maximum fee assessable by state law prior to credits given for ad valorem taxes and for additional cost of financing less interest earnings on debt

B. Plan for Financing and the Ad Valorem Tax Credit

Chapter 395 of the Texas Local Government Code requires the Transportation Impact Fee Capital Improvements Plan for Roadway Impact Fees to contain specific enumeration of a plan for awarding the impact fee credit. Section 395.014 of the Code requires:

- (A) a credit for the portion of ad valorem tax and utility service revenues generated by new service units during the program period that is used for the payment of improvements, including the payment of debt, that are included in the transportation improvements plan; or
- (B) In the alternative, a credit equal to 50 percent of the total projected cost of implementing the transportation improvements plan..."

The plan is summarized, as prepared by NewGen Strategies in Appendix D and Appendix E, Plan for Awarding the Roadway Impact Fee Credit. The following continuation of Table 7 summarizes the portions of Table 8 that utilize this credit calculation.

Line	Title	Description
18	Financing Costs	(from Appendix D – Plan for Awarding the Transportation Impact Fee Credit)
19	Interest Earnings	(from Appendix D – Plan for Awarding the Transportation Impact Fee Credit)
20	Credit for Ad Valorem Taxes	A credit for the portion of ad valorem taxes projected to be generated by the new service units, as per Section 395.014 of the Local Government Code. (from Appendix E – Plan for Awarding the Transportation Impact Fee Credit)
21	Recoverable Cost of the Total Transportation Impact Fee CIP and Financing	The Cost of the CIP Attributable to New Growth (Line 16) plus Financing Costs (Line 18), less Interesting Earnings (Line 19), less the Credit for Ad Valorem Taxes (Line 20). (Line 16 + Line 18 + Line 19 + Line 20)
22	Maximum Assessable Fee Per Service Unit	Found by dividing the Recoverable Cost of the CIP and Financing (Line 21) by the Total Vehicle-Miles of New Demand Over Ten Years (Line 8). (Line 21 / Line 8)

Table 7 (Continued). Maximum Assessable Transportation Impact Fee Computation

C. Maximum Assessable Impact Fee Determination

The impact fee determination method employed by NewGen Strategies and Solutions, LLC is developed through a financial based model, which fully recognizes the requirements of Chapter 395, including the recognition of cash and/or debt financing, interest earnings, fund balances, and applicable credits associated with the use of ad valorem taxes. In developing the components of the financial model several assumptions must be made, including the following:

- Financing
  - Method of financing (i.e. cash or debt financing)
  - o The level of financing (e.g. 100% debt)
  - Cost of financing
  - o Debt repayment structure
- Timing and Level of Expenditures and Revenues
- Interest Earnings
- Annual Service Unit Growth
- Portion of Ad Valorem Tax Revenue Used to Fund Impact Fee Roadway Improvements

The assumptions employed in the maximum assessable impact fee determination provide a reasonable basis for forecasting, however, it must be emphasized that these assumptions may not necessarily reflect actual future conditions. To address this, Chapter 395 requires the monitoring of impact fees through the Impact Fee Advisory Committee and allows for the option to update or revise impact fees to reflect the actual implementation of the impact fee program.

Once the cost of capacity added that is attributable to growth (Table 8 - line 16) is determined, it must then be decided how the cost will be financed: cash and/or debt. For any previously funded projects, whether partially funded or in full, actual costs of capital have been included. Based on discussions with City staff, unless specific funding has already been determined, it is assumed that the City will debt finance 100% of the future project costs. For debt financing, the cost of financing is based on the City's Financial Advisor's estimates of

future debt costs for bonds issued with 20-year terms, as shown in Appendix D. Debt service payments for each future debt issue are assumed to remain constant over the issue's term.

Currently, the exact timing and annual level of capital expenditures over the 10-year forecast is indeterminate; therefore, it is assumed that capital expenditures will occur in equal amounts over the 10-year program period. It is also assumed that for debt financed capital projects, the City will expend debt proceeds over a 3-year timeframe. For the calculation of the maximum assessable impact fee, debt is assumed to be issued in equal amounts for each year. In order to recognize the full amount of debt to be issued for the cost of capacity added that is attributable to growth during the 10-year period, a portion of years 8, 9, and 10 are assumed to be spent in the final 3 years.

Because debt is issued over 20-year terms and impact fees developed herein are to be charged over a10-year period, sufficient fund balance must be generated to meet the future debt service obligations. Because of the generation of the fund balance, excess monies will be available for interest earnings. Chapter 395 states that interest earnings are funds of the impact fee account and are to be held to the same restrictions as impact fee revenues. Therefore, in order to recognize that interest earnings are used to fund roadway improvements, interest earnings are credited against the costs recoverable through impact fees. It should be noted that Chapter 395 does not require the upfront recognition of interest earnings in the impact fee determination; however, in an effort to acknowledge the time value of the impact fee payers' monies, interest earnings have been credited. Interest is assumed to be earned at an annual rate of 0.62% based on the TexStar 10-year average rate as of October 2020.

As with the timing and level of the capital expenditures over the 10-year forecast, the timing and annual level of service unit growth over the 10-year program period is indeterminate at the present time. As such, it is assumed that service unit growth will be consistent over the 10year forecast.

Chapter 395 requires a plan for awarding either a credit for the portion of ad valorem tax and/or utility service revenues generated by new service units during the program period that are used for payment of improvements that are included in the TIF CIP. As an alternative, a credit equal to 50% of the total cost of implementing the TIF CIP may be used. The City has elected to pursue the determination of a credit for the portion of ad valorem tax revenues generated by new service units during the program period that are used for payment of improvements that are included in the TIF CIP. It should be noted that the credit is not a determination to recognize the total ad valorem tax revenue generated by new service units but is only a credit for the portion of ad valorem tax revenue that is used for payment of improvements that are included in the TIF CIP. Theoretically, the credit determination could be zero (\$0) if the City does not utilize any of the new service unit ad valorem tax revenue to fund improvements that are included in the TIF CIP. However, to be conservative and recognize potential cash flow issues that can occur with the funding of major capital improvement projects, it is assumed that the debt-funded projects (50% of the improvement costs included in the TIF CIP) could potentially be funded by ad valorem tax revenue.

Since payments made through ad valorem tax revenue will consist of not only the revenue generated by new service units in the defined service area, but also existing property owners throughout the City, the portion attributable to the new service units in the defined service area must be isolated, as illustrated in the credit calculation in Appendix D.

#### Table 8. Maximum Assessable Transportation Impact Fee

# D. Service Unit Demand Per Unit of Development

The Transportation Impact Fee is determined by multiplying the impact fee rate by the number of service units projected for the proposed development. For this purpose, the City will utilize the Land Use/Vehicle-Mile Equivalency Table (LUVMET), presented in Table 9. This table lists the predominant land uses that may occur within the City of Georgetown. For each land use, the development unit that defines the development's magnitude with respect to transportation demand is shown. Although every possible use cannot be anticipated, the majority of local uses are found in this table. The descriptions for each land use are presented in Table 10. If the exact use is not listed, one similar in trip-making characteristics can serve as a reasonable proxy. The individual land uses are grouped into categories, such as residential, office, commercial, industrial, and institutional.

The trip rates presented for each land use is a fundamental component of the LUVMET. The trip rate is the average number of trips generated during the afternoon peak hour by each land use per development unit. The next column in Table 9, if applicable to the land use, presents the percentage of trips to and from certain land uses reduced by pass-by trips, as previously discussed.

The definitive source of the trip generation and pass-by statistics is the *ITE Trip Generation Manual*, 10<sup>th</sup> Edition, the latest edition. This manual utilizes trip generation studies for a variety of land uses throughout the United States, and is the standard used by traffic engineers and transportation planners for traffic impact analysis, site design, and transportation planning. However, for land uses not contained within the 10<sup>th</sup> Edition of the *ITE Trip Generation Manual*, an alternative service unit demand could be calculated by completing a trip generation study based on the procedure identified in the *ITE Trip Generation Handbook*.

To convert vehicle trips to vehicle-miles, it is necessary to multiply trips by trip length. The trip length values are based on the CAMPO long range transportation model and supplemented by the *National Household Travel Survey* performed by the FHWA. The other adjustment to trip length is the 50% origin-destination reduction to avoid double counting of trips. At this

stage, another important aspect of the state law is applied – the limit on transportation service unit demand. If the adjusted trip length is above six (6) miles, the maximum trip length used for calculation is reduced to six (6) miles. This reduction, as discussed previously, limits the maximum trip length to the approximate size of the service areas.

The remaining column in the LUVMET shows the vehicle-miles per development unit. This number is the product of the trip rate and the maximum trip length. This number, previously referred to as the *Transportation Demand Factor*, is used in the impact fee to compute the number of service units attributed to each land use category. The number of service units is multiplied by the impact fee rate (established by City ordinance) in order to determine the impact fee for a development.

### Table 10. Land Use Descriptions

Land Use Category	ITE Land Use Code	Land Use Description
PORT AND TERMINAL		
Truck Terminal	030	Point of goods transfer between trucks, between trucks and rail, or between trucks and ports
INDUSTRIAL		
General Light Industrial	110	Emphasis on activities other than manufacturing in a free-standing facility devoted to a single use
Industrial Park	130	Contains a number of industrial or related facilities; characterized by a mix of highly diversified facilities
Manufacturing	140	Primary activity is conversion of raw materials or parts into finished products
Warehousing	150	Devoted to storage of materials but may include office and maintenance areas
Mini-Warehouse	151	Facilities with a number of units or vaults rented to others for the storage of goods
RESIDENTIAL		
Single-Family Detached Housing	210	Single-family detached homes on individual lots
Multifamily Housing (Low-Rise)		Multi-family housing with one or two levels (floors) per building
Multifamily Housing (Mid-Rise)	221	
Multifamily Housing (High-Rise)		Multi-family housing with more than ten levels (floors) per building
Mobile Home Park / Manufactured Home		Consists of manufactured homes that are sited and installed on permanent foundations
Senior Adult Housing-Detached		Consists of detached independent living developments that include amenities such as golf courses and swimming pools
Senior Adult Housing-Attached		Consists of attached independent living developments that include limited social or recreation services
Assisted Living LODGING	254	Residential settings that provide either routine general protective oversight or assistance with activities
Hotel	310	Lodging facilities that typically have on-site restaurants, lounges, meeting and/or banquet rooms, or other retail shops and services
Motel / Other Lodging Facilities	320	Lodging facilities that may have small on-site restaurant or buffet area but little or no meeting space
RECREATIONAL		
Golf Driving Range	432	Facilities with driving tees for practice; may provide individual or group lessons; may have prop shop and/or refreshment facilities
Golf Course	430	May include municipal courses and private country clubs; may have driving ranges, pro shops, and restaurant/banquet facilities
Recreational Community Center		Category includes stand-alone public facilities often including classes and clubs for adults and children including YMCAs
Ice Skating Rink	465	Rinks for ice skating and related sports; may contain spectator areas and refreshment facilities
Miniature Golf Course	431	One or more individual putting courses; category should not be used when part of a mulitpurpose entertainment center (e.g. batting cages, go-carts)
Multiplex Movie Theater	445	Movie theater with audience seating, minimum of ten (10) screens, lobby, and refreshment area.
Racquet / Tennis Club	491	Indoor or outdoor facilities specifically designed for playing tennis
INSTITUTIONAL		
Religious Place of Worship	560	All places of worship
Day Care Center	565	Generally includes facilities for care of pre-school aged children, generally includes classrooms, offices, eating areas, and playgrounds
Elementary School	520	Serves students attending kindergarten through the fifth or sixth grade; ususally located in residential communities
Middle School / Junior High School	522	Serves students who have not yet entered high school, and have completed elementary school
High School	530	Serves students who have completed middle or junior high school
Junior / Community College	540	Two-year junior, community, or technical colleges
University / College	550	Four-year universities or colleges that may or may not offer graduate programs
MEDICAL	(20)	
Clinic	630	Facilities with limited diagnostic and outpatient care
Hospital	610	Medical and surgical facilities with overnight accommodations
Nursing Home	620 640	Rest homes, chronic care, and convalescent homes with residents who do little or no driving
Animal Hospital/Veterinary Clinic OFFICE	040	Facilities that specialize in the medical care and treatment of animals
	714	Office building housing comparets bacdquarters of a single compare a survey of sectors
Corporate Headquarters Building General Office Building		Office building housing corporate headquarters of a single company or organization
Medical-Dental Office Building		Office buildings which house multiple tenants Multi-tenant building with offices for physicians and/or dentists
		Single tenant office buildings other than corporate headquarters
Single Tenant Office Building		

## Table 10 (Cont'd). Land Use Descriptions

Land Use Category	ITE Land Use Code	Land Use Description
COMMERCIAL		
Automobile Related		
Automobile Care Center	942	Automobile repair and servicing including stereo installations and upholstering
Automobile Parts Sales	843	Retail sale of auto parts but no on-site vehicle repair
Gasoline/Service Station	944	Gasoline sales without convenience store; may include repair or car wash
Gasoline/Service Station w/ Conv Market and Car	946	Gasoline sales with convenience store where the primary business is gasoline sales, with at least 10 fueling positions
New Car Sales	841	Used automobile sales dealerships; may include automobile servicing, and parts sales
Quick Lubrication Vehicle Shop	941	Primary business is to perform oil changes and fluid/filter changes with other repair services not provided
Self-Service Car Wash	947	Has stalls for driver to park and wash the vehicle manually
Tire Store	848	Primary business is sales and installation or repair of tires; usually do not have large storage or warehouse area
Dining		
Fast Food Restaurant with Drive-Thru Window	934	High-turnover fast food restaurant for carry-out and eat-in customers with a drive-through window
Fast Food Restaurant without Drive-Thru Window	933	High-turnover fast food restaurant for carry-out and eat-in customers, but without a drive-through window
High Turnover (Sit-Down) Restaurant	932	Restaurants with turnover rates less than one hour; typically includes moderately-priced chain restaurants
Quality Restaurant	931	Restaurants with turnover rates of one hour or longer; typically require reservations
Coffee/Donut Shop with Drive-Thru Window	937	Coffee and Donut restaurants with drive-through windows, hold long store hours and have limited indoor seating
Other Retail		
Free-Standing Discount Store	815	Category includes free-standing stores with off-street parking; typically offer a variety of products and services with long store hours
Nursery (Garden Center)	817	Building with a yard of planting or landscape stock; may have office, storage, shipping or greenhouse facilities
Home Improvement Superstore	862	Warehouse-type facilities offering a large variety of products and services including lumber, tool, paint, lighting, and fixtures, among other items.
Pharmacy/Drugstore w/o Drive-Thru Window	880	Facilities that primarily sell prescription and non-prescription drugs without a drive-through window
Pharmacy/Drugstore w/ Drive-Thru Window	881	Facilities that primarily sell prescription and non-prescription drugs with a drive-through window
Shopping Center	820	Integrated group of commercial establishments; planning, owned, and managed as a unit
Supermarket	850	Primary business is sale of groceries, food, and household cleaning items; may include photo, pharmacy, video rental, and/or ATM
Toy/Children's Superstore	864	Businesses specializing in child-oriented merchandise
Department Store	875	Free-standing stores that specialize in the sale of apparel, footwear, bedding, home products, jewelry, etc.
SERVICES		
Walk-In Bank	911	Banks with their own parking lots, no drive-in lanes but contain non-drive-through ATMs
Drive-In Bank	912	Banking facilities to conduct financial transactions from the vehicle; also usually a part of walk-in bank
Hair Salon	918	Facilities that specialize in cosmetic and beauty services including hair cutting and styling

# VI. SAMPLE CALCULATIONS

The following section details two (2) examples of maximum assessable Transportation Impact Fee calculations.

Example 1:

Development Type - One (1) Unit of Single-Family Housing in Service Area A

	Roadway Impact Fee Calculation Steps – Example 1				
	Determine Development Unit and Vehicle-Miles Per Development Unit				
Step	From Table 9 [Land Use – Vehicle-Mile Equivalency Table]				
1	Development Type: 1 Dwelling Unit of Single-Family Detached Housing Number of Development Units: 1 Dwelling Unit Veh-Mi Per Development Unit: 4.26				
Determine Maximum Assessable Impact Fee Per Service Unit (Vehicle-Mil					
Step 2 From Table 8, Line 22 [Maximum Assessable Fee Per Service Unit]					
2	Service Area A: \$1,699				
	Determine Maximum Assessable Impact Fee				
Step 3	Impact Fee = # of Development Units * Veh-Mi Per Dev Unit * Max. Fee Per Service Unit Impact Fee = 1 * 4.26 * \$1,699 Maximum Assessable Impact Fee = \$7,327.34				

Example 2:

Development Type – 100,000 square foot Home Improvement Superstore in Service Area C

Roadway Impact Fee Calculation Steps – Example 2	
Step 1	Determine Development Unit and Vehicle-Miles Per Development Unit
	From Table 9 [Land Use – Vehicle-Mile Equivalency Table]
	Development Type: 100,000 square feet of Home Improvement Superstore
	Development Unit: 1,000 square feet of Gross Floor Area Veh-Mi Per Development Unit: 3.85
Step 2	Determine Maximum Assessable Impact Fee Per Service Unit (Vehicle-Mile)
	From Table 8, Line 22 [Maximum Assessable Fee Per Service Unit]
	Service Area C: \$3,315
Step 3	Determine Maximum Assessable Impact Fee
	Impact Fee = # of Development Units * Veh-Mi Per Dev Unit * Max. Fee Per Service Unit Impact Fee = 100 * 3.85 * \$3,315 Maximum Assessable Impact Fee = \$1,276,275

# VII. ADOPTION AND ADMINISTRATION OF ROADWAY IMPACT FEES

# A. Adoption Process

Chapter 395 of the Texas Local Government Code stipulates a specific process for the adoption of Roadway Impact Fees. A Capital Improvements Advisory Committee, referred to as an Impact Fee Advisory Committee (IFAC) in this report and by the City of Georgetown, is required to review the Land Use Assumptions and Transportation Impact Fees CIP used in calculating the maximum fee, and to provide the Committee's findings for consideration by the City Council. This IFAC also reviews the calculation and resulting maximum fees and provides its findings to the City Council. The composition of the IFAC is required to adequately represent the building and development communities. The City Council then conducts a first public hearing on the Transportation Impact Fee Assumptions (Land Use and Capital Improvements Plan), which occurred on September 22, 2020, and a second public hearing, conducted on date TBD, on the Transportation Impact Fee Calculation and Roadway Impact Fee Ordinance.

Following policy adoption, the IFAC is tasked with advising the City Council of the need to update the Land Use Assumptions or the Transportation Impact Fees CIP at any time within five years of adoption. Finally, the IFAC oversees the proper administration of the Impact Fee, once in place, and advises the Council as necessary.

# B. Collection and Use of Transportation Impact Fees

Transportation Impact Fees are assessed when a final plat is recorded. The assessment defines the impact of each unit at the time of platting, according to land use, and may not exceed the maximum impact fee allowed by law. Transportation Impact Fees are collected when a building permit is issued. Therefore, funds are not collected until development-impacts are introduced to the transportation system. Funds collected within a service area can be used only within the same service area. Finally, fees must be utilized within 10 years of collection, or must be refunded with interest.

## VIII. CONCLUSIONS

The City of Georgetown has established a process to implement the assessment and collection of Transportation Impact Fees through the adoption of an impact fee ordinance that is consistent with Chapter 395 of the Texas Local Government Code.

This report establishes the 2020 maximum allowable Transportation Impact Fee that could be assessed by the City of Georgetown, as shown in the previously referenced Table 8.

This document serves as a guide to the assessment of Transportation Impact Fees pertaining to future development, and the City's need for transportation improvements to accommodate that growth. Following the public hearing process, the City Council may establish an impact fee amount to be collected, up to the calculated maximum and establish the Transportation Impact Fee Ordinance accordingly.

In conclusion, it is our opinion that the data and methodology used in this analysis are appropriate and consistent with Chapter 395 of the Texas Local Government Code. Furthermore, the Land Use Assumptions and the proposed Transportation Impact Fee Capital Improvements Plan are appropriately incorporated into the development of the maximum assessable Transportation Impact Fee.

Below is the listing of the 2020 Transportation Impact Fee Study's Maximum Assessable Impact Fee Per Service Unit (Vehicle-Mile):

Service Area	Maximum Fee Per Service Unit (per Vehicle-Mile)
Α	\$1,699
В	\$2,152
С	\$3,315
D	\$1,405
E	\$3,101
F	\$4,577
Sun City	\$1,247
Lake Georgetown	\$0
Downtown	\$0

Most of these roadways were 2 Lane Collectors or bridges over I-35 included as intersection projects.

Appendix D – Plan for Awarding the Street Impact Fee Credit Summary

Service Area A

Recoverable Impact Fee CIP Costs	\$ 31,984,275	Per Kimley-Horn Impact Fee Report
Financing Costs	12,770,857	See Detail Below
Interest Earnings	(2,459,442)	Page 3 of Appendix E - Service Area A
Pre Credit Recoverable Cost for Impact Fee	\$ 42,295,690	Sum of Above
Credit for Ad Valorem Revenues	(3,611,467)	Page 6 of Appendix E - Service Area A
Maximum Recoverable Cost for Impact Fee	\$ 38,684,223	

# Recoverable Impact Fee CIP Costs:

Represents the portion of capital improvement costs that are eligible for funding through impact fees. Reference is Service Area A column, per Kimley-Horn Impact Fee Report.

### Financing Costs:

Represents the interest costs associated with debt financing the new impact fee project costs. Interests costs are derived from existing debt issues and forecasted debt issues.

New Annual Debt Service	\$ 38,188,256 (Page 2 of Appendix E - Service Area A)
Existing Annual Debt Service	6,547,224 (Page 2 of Appendix E - Service Area A)
Principal Component	 (31,964,624) (Page 1 of Appendix E - Service Area A)
Financing Costs	\$ 12,770,857

# Interest Earnings:

Represents the interest earned on cash flows and assumes a 0.62% annual interest rate. The Impact Fee Statute states that interest earnings are funds of the impact fee account and are held to the same restrictions as impact fee revenues. Therefore in order to recognize that interest earnings are used to fund capital improvements, interest earnings are credited against the recoverable costs. Reference is the sum of recoverable costs. Reference is page 1 of Appendix E - Service Area A.

# Pre Credit Recoverable Cost for Impact Fee:

Represents Recoverable Impact Fee CIP Costs plus Financing Costs less Interest Earnings.

### Credit for Ad Valorem Revenues:

In 2001, the Impact Fee Statute was amended to include a credit for ad valorem and/or utility revenues generated by new service units during the ten-year timeframe that are used to fund impact fee eligible projects for which the new service units were charged an impact fee. The intent of this amendment is to avoid double-charging the new service units for impact fee capital improvements. The credit recognizes ad valorem revenues used to fund the debt service of debt financed impact fee eligible projects and assumes that all non-debt funded impact fee eligible project costs will be funded solely through impact fee revenues or non-ad valorem revenue sources. Reference is page 6 of Appendix E - Service Area A.

# Maximum Recoverable Cost for Impact Fee:

Service Area B

Recoverable Impact Fee CIP Costs	\$ 17,974,123	Per Kimley-Horn Impact Fee Report
Financing Costs	6,890,559	See Detail Below
Interest Earnings	(1,520,598)	Page 3 of Appendix E - Service Area B
Pre Credit Recoverable Cost for Impact Fee	\$ 23,344,084	Sum of Above
Credit for Ad Valorem Revenues	(929,575)	Page 6 of Appendix E - Service Area B
Maximum Recoverable Cost for Impact Fee	\$ 22,414,509	

# Recoverable Impact Fee CIP Costs:

Represents the portion of capital improvement costs that are eligible for funding through impact fees. Reference is Service Area B column, per Kimley-Horn Impact Fee Report.

### Financing Costs:

Represents the interest costs associated with debt financing the new impact fee project costs. Interests costs are derived from existing debt issues and forecasted debt issues.

New Annual Debt Service	\$ 23,914,129 (Page 2 of Appendix E - Service Area B)
Existing Annual Debt Service	930,902 (Page 2 of Appendix E - Service Area B)
Principal Component	(17,954,473) (Page 1 of Appendix E - Service Area B)
Financing Costs	\$ 6,890,559

# Interest Earnings:

Represents the interest earned on cash flows and assumes a 0.62% annual interest rate. The Impact Fee Statute states that interest earnings are funds of the impact fee account and are held to the same restrictions as impact fee revenues. Therefore in order to recognize that interest earnings are used to fund capital improvements, interest earnings are credited against the recoverable costs. Reference is the sum of recoverable costs. Reference is page 1 of Appendix E - Service Area B.

# Pre Credit Recoverable Cost for Impact Fee:

Represents Recoverable Impact Fee CIP Costs plus Financing Costs less Interest Earnings.

# Credit for Ad Valorem Revenues:

In 2001, the Impact Fee Statute was amended to include a credit for ad valorem and/or utility revenues generated by new service units during the ten-year timeframe that are used to fund impact fee eligible projects for which the new service units were charged an impact fee. The intent of this amendment is to avoid double-charging the new service units for impact fee capital improvements. The credit recognizes ad valorem revenues used to fund the debt service of debt financed impact fee eligible projects and assumes that all non-debt funded impact fee eligible project costs will be funded solely through impact fee revenues or non-ad valorem revenue sources. Reference is page 6 of Appendix E - Service Area B.

- (1) TexStar 10-Year Average Rate as of October 2020
- (2) Per Kimley-Horn Impact Fee Report
- (3) There is no existing fund balance because this is a new transportation impact fee
- (4) Per discussions with City Staff and City files
- (5) This assumes 0% of new project costs funded through sources other than debt, unless specified otherwise
- (6) This assumes 100% of new project costs funded through new debt issues, unless specified otherwise
- (7) Per Kimley-Horn Impact Fee Report
- (8) Assumes new debt issued in equal annual amounts
- (9) Per Financial Advisor as of October 2020
- (10) Assumes new debt proceeds expended over a 3-year timeframe

Non-debt funded capital expenditures allocated per discussions with City Staff

13		860,352
Total	\$	25,830,209

- (1) TexStar 10-Year Average Rate as of October 2020
- (2) Per Kimley-Horn Impact Fee Report
- (3) There is no existing fund balance because this is a new transportation impact fee
- (4) Per discussions with City Staff and City files
- (5) This assumes 0% of new project costs funded through sources other than debt, unless specified otherwise
- (6) This assumes 100% of new project costs funded through new debt issues, unless specified otherwise
  - (7) Per Kimley-Horn Impact Fee Report
  - (8) Assumes new debt issued in equal annual amounts
  - (9) Per Financial Advisor as of October 2020
  - (10) Assumes new debt proceeds expended over a 3-year timeframe Non-debt funded capital expenditures allocated per discussions with City Staff

13		246,011									
Total	\$	7,399,979									

- (1) TexStar 10-Year Average Rate as of October 2020
- (2) Per Kimley-Horn Impact Fee Report
- (3) There is no existing fund balance because this is a new transportation impact fee
- (4) Per discussions with City Staff and City files
- (5) This assumes 0% of new project costs funded through sources other than debt, unless specified otherwise
- (6) This assumes 100% of new project costs funded through new debt issues, unless specified otherwise
  - (7) Per Kimley-Horn Impact Fee Report
  - (8) Assumes new debt issued in equal annual amounts
  - (9) Per Financial Advisor as of October 2020
  - (10) Assumes new debt proceeds expended over a 3-year timeframe Non-debt funded capital expenditures allocated per discussions with City Staff

9		2,379,748
10		2,379,748
11		2,377,783
12		1,585,188
13		792,594
Total	\$	23,797,477

- (1) TexStar 10-Year Average Rate as of October 2020
- (2) Per Kimley-Horn Impact Fee Report
- (3) There is no existing fund balance because this is a new transportation impact fee
- (4) Per discussions with City Staff and City files
- (5) This assumes 0% of new project costs funded through sources other than debt, unless specified otherwise
- (6) This assumes 100% of new project costs funded through new debt issues, unless specified otherwise
  - (7) Per Kimley-Horn Impact Fee Report
  - (8) Assumes new debt issued in equal annual amounts
  - (9) Per Financial Advisor as of October 2020
  - (10) Assumes new debt proceeds expended over a 3-year timeframe Non-debt funded capital expenditures allocated per discussions with City Staff

- (1) TexStar 10-Year Average Rate as of October 2020
- (2) Per Kimley-Horn Impact Fee Report
- (3) There is no existing fund balance because this is a new transportation impact fee
- (4) Per discussions with City Staff and City files
- (5) This assumes 0% of new project costs funded through sources other than debt, unless specified otherwise
- (6) This assumes 100% of new project costs funded through new debt issues, unless specified otherwise
- (7) Per Kimley-Horn Impact Fee Report
- (8) Assumes new debt issued in equal annual amounts
- (9) Per Financial Advisor as of October 2020
- (10) Assumes new debt proceeds expended over a 3-year timeframe

Non-debt funded capital expenditures allocated per discussions with City Staff

Total	\$	23,820,708

- (1) TexStar 10-Year Average Rate as of October 2020
- (2) Per Kimley-Horn Impact Fee Report
- (3) There is no existing fund balance because this is a new transportation impact fee
- (4) Per discussions with City Staff and City files
- (5) This assumes 0% of new project costs funded through sources other than debt, unless specified otherwise
- (6) This assumes 100% of new project costs funded through new debt issues, unless specified otherwise
  - (7) Per Kimley-Horn Impact Fee Report
  - (8) Assumes new debt issued in equal annual amounts
  - (9) Per Financial Advisor as of October 2020
  - (10) Assumes new debt proceeds expended over a 3-year timeframe Non-debt funded capital expenditures allocated per discussions with City Staff
